PROBLEM STATEMENT-2

CXO HR Intelligence Dashboard

Description:

Senior HR leaders such as Chief HR Officers (CHROs) are responsible not only for managing organisational policies but also for maintaining meaningful relationships with employees. However, in modern organisations with hundreds or thousands of employees, personal and contextual information about employees is scattered across multiple systems such as HRMS platforms, spreadsheets, meeting transcripts, and email conversations.

Because these systems operate independently, HR leaders often lack the institutional memory required to remember past conversations, personal interests, or important employee concerns. As a result, quarterly check-ins and leadership conversations become generic and transactional rather than meaningful and relationship-driven.

This challenge requires participants to build an **AI-powered HR Intelligence Dashboard** that aggregates employee information from multiple sources such as HRMS systems, spreadsheets, and meeting transcripts. The system should construct a **unified employee profile** that includes both official data and relevant contextual insights extracted from past interactions.

The platform should include a **conversational AI assistant** that helps HR leaders prepare for employee check-ins, recall previous discussions, generate conversation starters, and optionally provide contextual suggestions during live meetings. The goal is to help HR leaders engage with employees in a more informed, empathetic, and personalised way at scale.

User:

- Chief HR Officers (CHROs)
- Senior HR Business Partners
- Talent and people operations leaders
- HR teams responsible for employee engagement and retention

Impact:

- **Improves employee engagement** by enabling more personalised and meaningful leadership conversations.
- **Provides institutional memory** by consolidating historical employee interactions and contextual information.
- **Enhances HR decision-making** with insights derived from employee communication patterns and sentiment trends.
- **Reduces preparation time** for leadership check-ins and HR meetings.

- **Helps identify early signals of employee concerns**, improving retention and workplace culture.

Tech that can be used:

- AI/LLMs for conversational assistants and summarisation
- Natural Language Processing for transcript analysis and insight extraction
- HRMS API integrations (Zoho People, BambooHR, Freshteam, etc.)
- Speech-to-text and transcript processing tools
- Secure backend systems for employee profile management
- Full-stack web dashboards (React, Node.js, Python, etc.)
- Cloud infrastructure and secure data storage
